

# InteliMonitor – Line Diagram Editor

ComAp InteliMonitor is a free SCADA SW for visualization of data in process applications. It can be customized to create visualization of individual systems as well as producing automatically generated screens using the supplied templates. With InteliMonitor you can adjust setpoints, view actual operating values and alarms, view history information and manually control gen-sets. This solution introduces the benefits of SCADA features directly via ComAp monitoring SW, with access to all values without the need for separate adjusting of communication interface, e.g. Modbus.

## Main Features:

- ▶ Adjusting setpoints, manual gen-set control and visualization of the system in one SW
- ▶ Automatically generated or custom SCADA drawings
- ▶ Customized SCADA visualization for CHP and complex systems
- ▶ Multi-level visualization: overview drawing and detailed views

You can create your own SCADA or use automatically generated drawings easily!

# Customers' experience of using IntelliMonitor

## FAR Diesel

SOUTH AFRICA

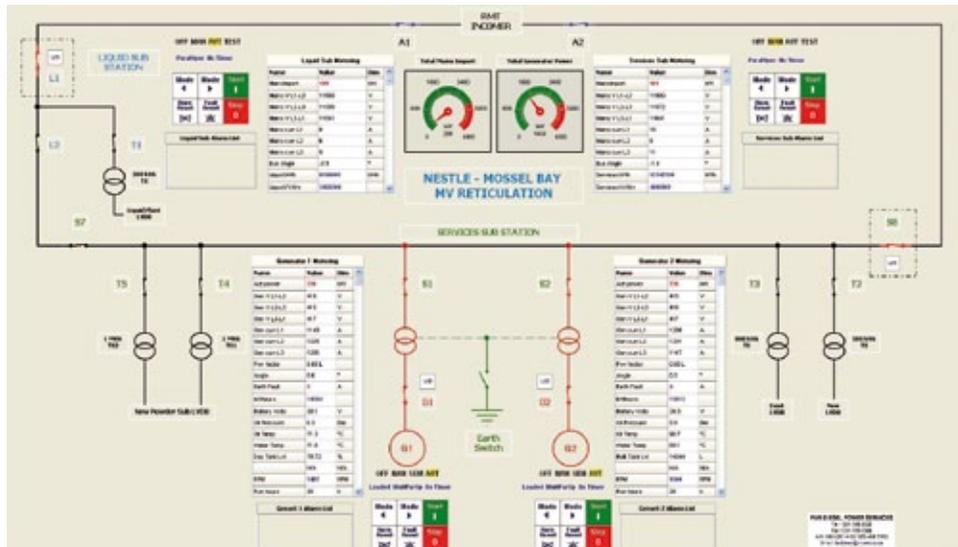

"FAR Diesel Power Services is a service orientated company and proud distributor of ComAp. Our company is dedicated to the Power Generation Industry in Southern Africa and Indian Ocean Islands.

One of the most amazing features of IntelliMonitor is the Line Diagram Editor. We use this program exclusively to design a SCADA system for each site which normally consists of a high performance desktop PC with 2x split screen 24" LCD HD monitors. When you are able to provide a customer with a fully functional professional SCADA system to operate and monitor the entire system locally or remotely via internet, at no additional software cost or annual license fees, the system literally is unmatched by any of ComAp's competitors. The solution provided to the customer is far more professional & cost effective than any other single solution currently available. The IntelliMonitor and Line Diagram Software is very user friendly and does not require any special training to enable one to use it. This is another important consideration by many clients, as it allows them to make changes to the system without incurring the expense of specialised software support companies.

The ComAp's SCADA package embedded in IntelliMonitor allows us a clear advantage over our competitors current solutions. It has allowed us to easily secure large turnkey projects, as the old adage still holds true, 'a picture is worth a thousand words'."

Brendan Fike, Managing Director

## Tedom

CZECH REPUBLIC

"We started using IntelliMonitor software in our company TEDOM a. s. shortly after it was launched. We use it for local and remote communication with both 'New Technology' and 'Classic' line controllers. We really appreciate the efforts made by ComAp people to further develop the software making it more user-friendly and introducing new functions.

Because this software is frequently used by our customers, who are in most cases operators of CHP units, I would like to high-light the 'Line Diagram Editor' function which has been continuously improved and enables us to create customized SCADA applications. These technological schemes of customers' sets allow operators to see all the measured values as well as the general electrical scheme of the whole installation on a single screen. They find this feature very beneficial and widely appreciated especially in complex installations with multiple mains feeders and bus tie breakers."

Petr Sedlák, Electrical Department Manager
